6820A series Scalar Analyzers

6821A	1 MHz to 3 GHz Scalar Analyzer
6822A	10 MHz to 8.4 GHz Scalar Analyzer
6823A	10 MHz to 20 GHz Scalar Analyzer
6824A	10 MHz to 24 GHz Scalar Analyzer
6825A	10 MHz to 46 GHz Scalar Analyzer
6825AR	10 MHz to 40 GHz Scalar Analyzer

Synthesized Source

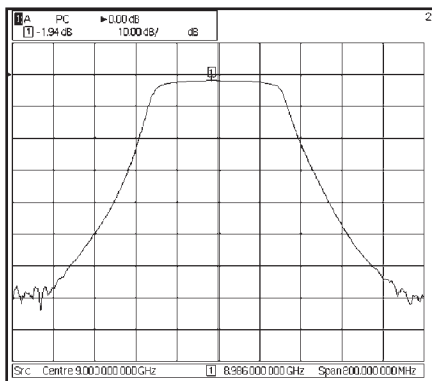

The synthesized source has low phase noise and 1 Hz frequency resolution. VCOs are used for frequencies above 3 GHz and an integrated RF synthesizer for the 1 MHz to 3 GHz range. Optionally increased output power is available from 3 to 24 GHz. Internal filtering results in excellent harmonic performance of <-50 dBc (70 MHz to 24 GHz) for improved scalar measurement accuracy. Optional step attenuators are available to set low output powers for amplifier or receiver testing.

In CW mode the source can be used for local oscillator substitution. A power sweep is provided for amplifier gain compression testing. External FM can be applied by connecting an AF generator to the rear panel. The internal modulation option provides frequency modulation of the source or pulse patterns for internal or external pulse modulators. The internal pulse modulator option allows either an external pulse generator to be connected via a rear panel BNC connector or utilizes the pulse patterns available from the internal modulation option. The pulse patterns may be configured and selected in either single pulse or multi-pulse formats.

When used with the scalar analyzer the source provides a swept synthesized output for frequency characterization of components and systems.

Scalar Analyzer

The three input scalar analyzer provides network characterization of components and systems. Simultaneous measurement of insertion and return loss are displayed on the 6820 color screen. Excellent measurement accuracy is assured by the use of EEPROM corrected detectors.

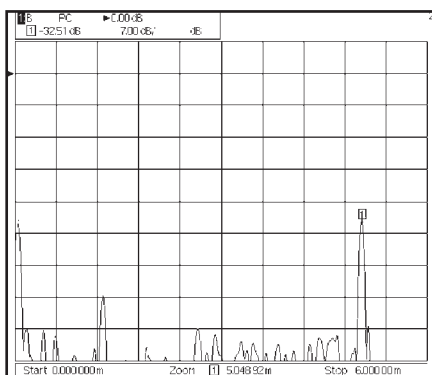

Bandpass filter insertion loss measurement

Each detector is individually characterized for linearity and frequency response to provide a measurement accuracy close to that achieved with a power sensor. A range of autotesters with high directivity is available for return loss measurements.

Fault Location

Fault location software is standard on all 6820A series instruments. Many modern communication systems rely on a coaxial or waveguide feed between the transmitter and antenna. The fast fault location facility of the 6820A can quickly locate the position of faults causing poor return loss in the feed, which can seriously impact system performance.

Measurement resolution and accuracy is assured by the use of a synthesized source with up to 1601 measurement points.

Fault location measurement of a coaxial feed and antenna

Simplified User Interface

Integration of the source and scalar analyzer, and the built-in applications facility, makes operations faster and simpler. The operator uses a single interface to set up any measurement. This saves time and is easier than writing software to perform comprehensive network measurements.

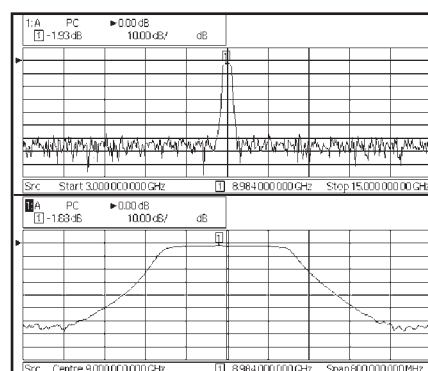

Eight softkeys give rapid access to all commonly used parameters. Softkeys are shaped to inform the user of the action that the key will perform, e.g. enter data, select from list, move to another menu or immediate action. All commonly accessed functions are no more than one level deep, so that the instrument operation is easily learned.

Applications Interface

An applications interface is built into the 6820A series which allows the user to create their own measurement routines and guide the operator through the test procedure. For example it can display on the 6820A screen how to set up the measurement, lead the operator through a calibration, show where to connect the device under test and then test the device's performance against predefined limits. The applications facility can reduce the incidence of operator error, improve measurement repeatability, provide guidance to infrequent users or simplify complex test procedures.

Color Display

A large TFT color display is fitted to the 6820A displaying up to four measurements on two channels. Scalar measurements can be displayed simultaneously on independent channels.

Dual channel display, showing wide band and narrow band frequency sweeps

Comprehensive Markers

Up to eight markers are available. The marker menus provide the tools that are most commonly used in each of the measurement modes.

In scalar mode markers automatically calculate peak to peak ripple, N-dB bandwidth, -1 dB bandwidth and find maximum and minimum signal levels. This simplifies device characterization and reduces test time.

For fault location measurements the next peak left/right feature identifies the position and magnitude of each of the discontinuities along the transmission line. The peak find softkey quickly locates the biggest discontinuity on the line.

Fast Field Repair

6820A has a modular architecture with modules slotted onto a common mother board. In the event of a module failure the instrument can be repaired by module replacement to reduce instrument downtime. Following a repair, software routines realign the replaced module.

Manufacturing Test

To the production manager the 6820A offers reduced programming time, reduced test time and simplified archiving of results. 6820A is fully compliant with the IEEE 488.2 GPIB standard. A full 401 data points can be transferred over the GPIB in typically <50 ms. Individual data points can be repetitively read in typically 10 ms. This enables full results archiving with minimal time penalty.

Continuity of test is essential in a production environment. A failed test system can result in expensive loss of output. 6820A with its field replaceable modules minimizes any output loss due to test system failure.

Installing and Maintaining Systems

During the installation period of a microwave system it is always necessary to revalidate key parameters. 6820A provides a comprehensive solution for installation teams. It is housed in a ruggedized case, has secure handles and can be supplied with a protective carrying case.

For systems with long waveguide or coaxial feeds the 6820 is used by the installation team to measure return loss and if necessary fault location. The synthesized source with 1601 measurement points ensures precise fault location measurements. AC Detection can be used for return loss and fault location measurements in the presence of interfering signals, a common cause of poor measurement performance in the field. In this mode the source output is chopped and the resulting pulsed signal is demodulated and processed in such a way that interference and zero drift are effectively cancelled.

By archiving results to external USB Flash Memory, or the internal instrument memory, the 6820A forms the basis of a preventative maintenance system. Experience shows that degradation in the antenna feed is the major source of system field failures. 6820A has the accuracy to monitor and identify gradual system degradation with time.

Additionally, the synthesized microwave source may be used in conjunction with the optional step attenuators, to carry out system sensitivity tests. The internal pulse modulator and modulation options with both single pulse and multi-pulse capability offers the ability to perform tangential sensitivity and range tests for many different types of radar systems

Results Logging and Outputting

Measurement results can either be saved to internal non-volatile memory or to USB Flash Memory. Traces saved via USB can then be archived or imported into a spreadsheet for viewing.
