## PM 6681 / PM 6681R

## Timer / Counter / Analyzers Rubidium Frequency Reference / Counter / Calibrator

## PM 6681 : the highest performance timer/counter/ analyzer available

The PM 6681 from Fluke sets the new standard for measurement and analysis of time intervals, frequency, phase and jitter. For development, calibration or challenging production test applications, the PM 6681 is the leader.

Check these key PM 6681 performance parameters, and compare the new state-of-the-art for yourself:

- 50 ps single-shot time interval resolution (1 ps averaged)
- 1.25 mV vertical resolution
- 300 MHz range, options to 8 GHz
- 8 k readings/s to internal memory
- 250 readings/s over GPIB
- Continuous single-period measurements at up to 40 k readings/s
- Unique hold-off and arming delay facilities to measure any part of any complex signal
- TimeView ${ }^{\text {TM }}$ PC software for time and frequency analysis

So for the ultimate performance, choose the advanced PM 6681.

## PM 6681R: ideal for calibration applications

The Rubidium reference of the PM 6681R makes this instrument the most accurate Frequency Reference/Counter/Calibrator for the calibration of frequency, time or phase.

- High accuracy and short warmup times:
5 min . to lock $4 \times 10^{-10}$ within $>10 \mathrm{~min}$. Aging $1 \times 10^{-9}$ in 10 year
- Calibrates Frequency, Time or Phase
- Calibrates any application specific frequency
- 5x 10 MHz \& 1 x 5 MHz buffered reference outputs

## Measuring Functions

Refer to table 1 for uncertainty information. Inputs A and B can be swapped internally in all modes except Rise and Fall Time.

## Frequency A, B, C

Range:
Input $A$ :
Input $B$ :
Input C:
$10^{-10} \mathrm{~Hz}$ to 300 MHz
$10^{-10} \mathrm{~Hz}$ to 100 MHz
2.7 GHz or 8 GHz with options

Resolution:

## Frequency Burst $A$, B, C

Frequency and PRF of burst signals can be measured without external control signal and with selectable start arming delay.

Range:
nput A:
Input B:
Input C:
Up to 300 MHz
Up to 100 MHz
Up to 8 GHz with options
200 ns to $1 \mathrm{~s}, 100 \mathrm{~ns}$ resolution

Start Delay Range

## Period $A$

| Range: | 3.3 ns to 10 s |
| :--- | :--- |
| Resolution: | 11 digits in 1 s measuring time |

## Ratio $A / B, C / B$

Range:
Frequency Range:
Input $A, B$ :
Input C:
$10^{-9}$ to $10^{15}$
$10^{-10} \mathrm{~Hz}$ to 160 MHz
2.7 GHz or 8 GHz with options

Time Interval $\boldsymbol{A}$ to $\mathbf{B}$

| Range: | 0 ns to $10^{10} \mathrm{~s}$ |
| :--- | :--- |
| Resolution |  |
| single shot: <br> Frequency Range: | $50 \mathrm{ps}(1 \mathrm{ps}$ average) |
|  | Up to 160 MHz |
| Pulse Width $\boldsymbol{A}$ |  |
| Range: 3 ns to $10^{10} \mathrm{~s}$ <br> Frequency Range: Up to 160 MHz |  |

## Rise and Fall Time $A$

Range:
Frequency Range:
Input Amplitude:

Phase A Relative B

| Range: | $-180^{\circ}$ to $+360^{\circ}$ |
| :--- | :--- |
| Resolution: | 0.01 |
| Frequency Range: | 0.03 Hz to 160 MHz |

Duty Factor $A$
Range:
Frequency Range:
0 to 1
0.11 Hz to 160 MHz

Totalize A, B

## Range: <br> Frequency Range:

A Gated by B:

A Start/Stop by B:
Manual A-B:

0 to $10^{17}, 0$ to $10^{10}$ in A-B modes
0 to 160 MHz
Event counting on Input A during the presence of a pulse on Input B. Single or cumulative event counting during set measuring time Event counting on Input A between two consecutive pulses on Input B Input A minus Input B event counting with manual start and stop

Input A minus Input B event counting with manual start. Stop after set measuring time. Time counted from first trigger event on A.

## AC/DC Voltage A, B

Range:
Frequency Range:
Mode:
Resolution:
Gated Volt:
-50 V to +50 V
DC, 1 Hz to 100 MHz
$\mathrm{V}_{\text {max }}, \mathrm{V}_{\text {min }}, \mathrm{V}_{\mathrm{p}-\mathrm{p}}$
1.25 mV

External masking of unwanted signal components such as overshoot

Not discernible, neglectable versus $1^{\circ} \mathrm{C}$ temperature variation.
n.a. 1 After 48 hours of continuous operation, PM9692 typical value $1 \times 10^{-10} / 24 \mathrm{~h}$
2 Atter 1 month of continuous operation
3 3 Tpical value

Explanation
Calibration Adjustment Tolerance is the maximal tolerated deviation from the true 10 MHz frequency after a calibration. When the reference frequency does not exceed the tolerance limits at the moment of calibration, an adjustment is not needed.
Total uncertainty is the total possible deviation from the true 10 MHz value under influence of frequency drift due to ageing and ambient temperature variations versus the reference temperature. The operating temperature range and the calibration interval are part of this specification.
