

HP 8644A specifications

Specifications describe the instrument's warranted performance and apply 24 hours after the unit has been connected to the ac power and 10 minutes after instrument turn on.

Modes

Front panel Synthesis Mode keys are used to select between good spectral purity or high deviation FM with faster frequency switching speed. Normal instrument operation uses "AUTO" mode selection which selects the best possible spectral purity for any modulation setting. The standard unit has Mode 1 for high FM deviations and Mode 2 for good spectral purity. Mode 3 is available with Option 004 which improves spectral purity but has lower FM deviations. With this option installed, all standard performance is still available and will be selected automatically with high FM deviations or can be selected manually for improved switching speed. Modes 4 and 5 are presently not used on the HP 8644A.

Supplemental Characteristics are intended to provide information useful in applying the instrument by giving typical, but not warranted performance. These characteristics are shown in italics or labeled as "typical", "approximate", or "nominal".
