## DFARS/Restricted Rights Notice

If software is for use in the performance of a U.S. Government prime contract or subcontract, Software is delivered and licensed as "Commercial computer software" as defined in DFAR 252.227-7014 (June 1995), or as a "commercial item" as defined in FAR 2.101(a) or as "Restricted computer software" as defined in FAR 52.227-19 (June 1987) or any equivalent agency regulation or contract clause. Use, duplication or disclosure of Software is subject to Agilent Technologies' standard commercial license terms, and non-DOD Departments and Agencies of the U.S. Government will receive no greater than Restricted Rights as defined in FAR 52.227-19(c)(1-2) (June 1987). U.S. Government users will receive no greater than Limited Rights as defined in FAR 52.227-14 (June 1987) or DFAR 252.227-7015 (b)(2) (November 1995), as applicable in any technical data.

## Definitions

All specifications and characteristics apply over a $25^{\circ} \mathrm{C} \pm 5^{\circ} \mathrm{C}$ range (unless otherwise stated) and 90 minutes after the instrument has been turned on.
Specification (spec.): Warranted performance. Specifications include guardbands to account for the expected statistical performance distribution, measurement uncertainties, and changes in performance due to environmental conditions.
Characteristic (char.): A performance parameter that the product is expected to meet before it leaves the factory, but that is not verified in the field and is not covered by the product warranty. A characteristic includes the same guardbands as a specification.
Typical (typ.): Expected performance of an average unit which does not include guardbands. It is not covered by the product warranty.
Nominal (nom.): A general, descriptive term that does not imply a level of performance. It is not covered by the product warranty.
Calibration: The process of measuring known standards to characterize a network analyzer's systematic (repeatable) errors.
Corrected (residual): Indicates performance after error correction (calibration). It is determined by the quality of calibration standards and how well "known" they are, plus system repeatability, stability, and noise.
Uncorrected (raw): Indicates instrument performance without error correction. The uncorrected performance affects the stability of a calibration.
Standard: When referring to the analyzer, this includes no options unless noted otherwise.
