## 与W1TCHES

DiCon＇s GP700 switch modules offer complete fiberoptic switching solutions． The modules are high－precision， lowtoss optical switches used for cable and component testing，remote fault locating，and optical signal routing． The GP700 provides accurate positioning for either singlemode or multimode fibers resulting in low insertion loss and excellent repeatability． The GP700 can control up to $301 \times N$ switches and up to $642 \times 2,1 \times 2$ ，or On－Off switches．Larger configurations can be accommodated using multiple housings．

## FE円TURES

－Very low insertion loss
Low back－reflection
－Excellent repeatability

## Configurations

## 与以1TCHE＝

The $1 \times \mathrm{N}$ Switch precisely aligns one common fiber to any of N input／output fibers． $1 \times \mathrm{N}$ optical switches operate bidirectionally and can be built with up to 100 channels．

The Synchronous Duplex $1 \times \mathrm{N}$ Switch consists of a set of two common input fibers that move as a group（synchronously）into alignment with a corresponding set of two output fibers．

The $2 \times N$ Switch uses cascaded $1 \times 2$ and $1 \times N$ switches to form a $2 \times N$ configuration．The $1 \times 2$ switch is typically used to switch facility．

The Low－Loss $2 \times N$ Non－Blocking Switch has two input fibers aligned to two output fibers，and can be switched in one－channel
increments．The two input fibers can be aligned to any two increments．The two

The Low－Loss $2 \times \mathrm{N}$ Blocking Switch has two common fibers aligned to one output fiber．This configuration optically functions
the same as a standard $2 \times \mathrm{N}$ Svitch（cascaded $1 \times 2$ and $1 \times \mathrm{N}$ ）． the same as a standard $2 \times \mathrm{N}$ Switch（cascaded
but has approximately half the insertion loss．

The M×N Blocking Switch consists of a $1 \times M$ and a $1 \times N$ switch usion spliced together．The positions of the two modules can any output．

GP700 can control up to $642 \times 2,1 \times 2$ ，or On－off Switche xampe，several $1 \times 2$ switches can be configu GP700 housing for redundant security switching applications．

## MxN Mftrix Switches

## Specifications ${ }^{1}$

DiCon＇s GP700 MxN Matrix Switch module routes optical signals through passive switch elements without optical－to－electrical conversions．The M×N Matrix Switch operates independently of signal wavelength，direction， bandwidth，data rate，and data format with virtually no crosstalk．The directional matrix switch is used to connect any one input to any one output．The distributional matrix switch is used to connect any one input to one，several， or all outputs．Both models of the M×N Matrix Switch are available in simplex or duplex configurations．

## FE円TURES

－Very low insertion loss
－Low back－reflection
－Simplex and duplex configurations
－High reliability and durability
－Matrix dimensions up to $15 \times 15$

## 円ャアL1C円T1ロNS

The GP700 M×N Matrix Switch is used for fully reconfigurable factory and network testing． Because the GP700 Matrix Switch is optically pas－ sive，the switch can be used in any type of fiber testing networks including FDDI，SONET，SDH，ATM and Fiber Channel．

| Insertion loss |  | 1.2 dB typ．， 2.4 dB max |
| :---: | :---: | :---: |
| Backreflection | singlemode | －55 dB max |
|  | multimode | －20 dB typ． |
| Repeatability |  | $\pm 0.04 \mathrm{~dB}$ max |
| PDL ${ }^{\text {3 }}$ |  | 0.1 dB max |
| Crosstalk |  | －80 dB max |
| Suitching time |  | 500 ms typ．， 750 ms max |

## Configurations

M×N Directional Matrix Switches are used to direct each input fiber port to a single output fiber port．Each input module consists of a $1 \times \mathrm{N}$ fiberoptic switch，and each output module consists of a $1 \times M$ fiberoptic switch．

M $\times N$ Distributional Matrix Switches are used to distribute any one input fiber port to one，several，or all output fibe splitter，and each output module consists of a $1 \times \mathrm{M}$ fiberoptic switch．
