

VIDEO TEST INSTRUMENTS

Introducing the latest video test instruments from Quantum Data for testing analog and digital video display devises. The 881 provides features for testing video displays in production environments. The 882 is its complement. It provides extended features to test video displays for development environments and quality assurance applications. Now with CEC support.

KEY FEATURES + BENEFITS

central administration

Update and configure all networked instruments from a single computer.

network control

Fully control instrument from any network location with web browser or Telnet client.

graphics SDK

Create complex patterns based on your specifications using C++ software development kit.

HDMI + DVI

Single link (up to 165 MHz) HDMI and DVI in same instrument.

HDMI + DVI Analyzer (882 only)

Single link analyzer (up to 150 MHz) for measuring source timing & pixel errors. Include formated reports.

CEC Utilities for development and compliance.

HDCP Production keys included with HDMI and DVI signals.

SDI / HD-SDI (Optional) Single link.

Auxiliary Channel Analzyer (ACA) Monitor DDC, HDCP, CEC and EDID transactions

easy to use Access powerful features easily using intuitive user interface.

DUT-based setup Specify device under test to automatically set up instrument.

multiple configurations

Save and restore different instrument configurations for different users or applications.

comprehensive timing + patterns

Include extensive library of standard timings and patterns. Add your own custom timings and patterns.

local pattern storage

Store multiple custom images (.bmp, .jpg and .png) images in instrument.

APPLICATION TESTS

| HDCP | |
|---|---|
| HDMI and DVI | Authentication and encryption of uncompressed HDMI and DVI signals |
| HDMI InfoFrames (882 | only) |
| HDMI | Verify InfoFrames sent to display |
| HDMI Pixel Repetition (| (882 only) |
| HDMI | Test gaming formats with variable horizontal resolution |
| HDMI Active Format De | escriptor (AFD) (882 only) Verify HDMI content mapping |
| HDMI Audio Tests | |
| Rate | Vary audio sampling rate to |
| Frequency | test sink handling Vary audio frequency to test |
| | sink handling |
| Amplitude | Vary audio amplitude to test sink handling |
| EDID Read | |
| HDMI, DVI, VGA | Auto-configuration of generator |
| Data channels | format list |
| Physical | I2C per VESA E-DDC |
| Protocols | DDC2B, E-DDC & DDC/Cl |
| | (reads E-EDID Ver 1.3) |
| EDID Testing | |
| HDMI, DVI, VGA | Reads EDID from display and |

ANALYZER OPTION (882 ONLY)

Use the DVI and HDMI analyzer option to test source products, such as set-top boxes, as well as repeaters and cables. Source product manufacturers will find this option invaluable for verifying signal quality, timing, color encoding, and E-EDID/E-DDC/HPD-related behavior.

The analyzer option adds a digital video receiver to the base instrument. This receiver emulates a sink device (display), while the generator output emulates a source (host) device. The receiver presents an on-the-fly reprogrammable E-EDID to the source, and analyzes incoming video for data errors and timing anomalies. The receiver can analyze video from the instrument itself or from an external source. Results can be displayed on the instrument's front panel or issued as formated reports.

The HDMI and DVI analyzer option converts the incoming digital signal to an analog signal, which can be connected to an analog display for monitoring incoming content. The analyzer also routes incoming audio to a SPDIF output, which can be connected to an external digital speaker or audio analyzer.

Signal quality can be measured without meticulous inspection of a display screen. The analyzer accepts standard QDI-BCM pseudo-random noise test patterns, which allow overall signal quality to be measured and expressed in simple objective terms. In cases where the analyzer is connected to a video source that does not support the rendering of pseudo-random noise data, a pixel error measurement technique can be alternately used, which counts flickering pixels in still-frame test images. Detailed pixel-by-pixel analysis is also supported for checking color encoding, scaling, and masking in test images.

Timing can be measured, independent of video content.

The analyzer option is also excellent for finding problems with repeaters, cables, cable extenders, and distribution systems. Everything needed to test transmission systems from end-to-end, using pseudo-random noise or test images, is now available in a single instrument.

Signal Analyzer Features

- > EEPROM Emulator emulates an EEPROM (up to 8 blocks) with rapid on-the-fly re-programmable E-EDID for testing how source devices respond to different sink devices.
- > Hot-Plug Generator generates hot-plug events in concert with E-EDID changes.
- > Timing Analyzer measures timing of external video signal.

Measurements: pixel rate, fields-per-frame, H and V rate/total/active, sync delay/width/polarity/ H-to-V alignment

Machine Unit Accuracy: zero tolerance

Frequency Accuracy: < 0.3%

> Pixel Data Analyzer measures pixel values and detects flickering pixels in user-defined region of 1024 square pixels.

Error Tallies: pixel errors (in static images)

Tally Range: 0 to 4095

- > Packet Analyzer displays InfoFrame, general control, audio sample, ACR, and generic data along with audio channel status and errors.
- > Pseudo-Noise Analyzer:

Noise type accepted: QDI-BCM

Error Tallies: Errors by channel (0, 1, and 2), total pixel errors, floating-point pixel error rate (in errors-per-billion)

Tally Range: 0 to 4095

PN Error Memory: One expected and one measured 24-bit value

Calibration: Pattern with known number of errors (PRN_5 or PRN_9)

- > AV Port for monitoring incoming HDMI signal, which is output as YPbPr component analog video and SPDIF digital audio.
- > HDCP for functionally testing content protection protocol (production key is provided).

Signal Generator Feature Extensions

The analyzer option enables these transmitterrelated features:

- > E-EDID Compliance Tester checks E-EDID of an HDMI sink device for compliance with VESA, CEA, and HDMI standards.
- > Pseudo-Noise Generator:

Noise Type Generated: QDI-BCM (source code provided)

Sequence Length: manually set from 4 to (2^31-1) pixels or automatically set to hActive*vActive

Bit-to-Bit Correlation: none

Noise Value Advance: manually choose between every pixel and active pixels only or automatically set to active pixels only

Sequence Repeat: continuous or stop after n=1 to 4,294,967,295 sequences

Seed Value: manually set form 0x00000001 to 0x7FFFFFF or automatically set to 0x08000001

Re-seed Logic: via "magic" pixel value

Re-seed Period: manually set from 3 to 2,147,483,647 pixels or automatically set to hActive*vActive

> Analyzer-related Images: FormatRx, PacketRx, ErrorRx, PRN_5, PRN_9

HDMI Hardware

- > Transmitter: Sil9030
- Links: Single

CEC: Consumer Electronics Control

Audio: 8-Ch L-PCM programmable sinewave (frequency and amplitude) at 32, 44.1, 48 88.2, 96, 176.4 and 192 kHz

- > Receiver: Sil9031
- Links: Single
- > AV Port

Analog video output

SPDIF digital audio input and output

Specifications are based on hardware and firmware revisions available as of May 2006, and are subject to change without notice. HDMI, the HDMI logo and High-Definition Multimedia interface are trademarks or registered trademarks of HDMI Licensing LLC.
