

TV Test Transmitter R&S®SFQ

Digital signals for antenna, satellite and cable

- Wide output frequency range from 0.3 MHz to 3300 MHz
- Large output level range for transmission, receiver and module measurements
- Standard DVB, DTV signals and FM satellite signals
- Several standards in one unit
- Flexible input interfaces
 - ASI, SPI, SMPTE310
- Output and input for I/Q signals
- Internal noise generator for highprecision C/N settings
- Internal BER measurement facility for all digital modulation modes

- Internal fading simulator
 - 6 or 12 paths
 - Profiles: Constant Phase, Rayleigh,
 Rice, Pure Doppler, Lognormal
 - Predefined and user-defined profiles
 - Fading output power selectable for sum signal or main path
- Antenna DVB-T
 - 2K and 8K COFDM
 - 6/7/8 MHz bandwidth
 - Hierarchical coding
- Antenna ATSC
 - 8VSB

- Antenna ISDB-T
 - Mode 1/2/3 (2k, 4k, 8k)
 - Max. 3 layers (A, B, C)
 - 13 segments (settable number for each layer)
 - DQPSK, QPSK, 16QAM, 64QAM
- Cable DVB-C
 - Selectable QAM:16, 32, 64, 128, 256QAM
- Cable J.83-B
 - Selectable QAM (64, 256QAM)
- Satellite DVB-S, DVB-DSNG
 - QPSK, 8PSK, 16QAM
- Satellite FM
 - PAL, SECAM, NTSC
 - FM and ADR sound subcarrier

Basic models — options for DVB/8VSB/ISDB-T/J.83-B, transmission simulation

Basic models

- DVB-T: R&S®SFQ02 + R&S®SFQ-B10
- ◆ ATSC: R&S®SFQ02 + R&S®SFQ-B12
- ◆ ISDB-T: R&S®SFQ02 + R&S®SFQ-B26
- ◆ DVB-C: R&S®SFQ02 + R&S®SFQ-B21
- ◆ J.83-B: R&S® SFQ02 + R&S®SFQ-B13
- DVB-S/-DSNG: R&S®SFQ02 + R&S®SFQ-B23
- ◆ FM: R&S®SFQ02 + R&S®SFQ-B2

DVB/VSB options

- Input interface (ASI, SPI, SMPTE310; settable symbol rate, accurate data clock)
- DVB-T coder
- Hierarchical coding for DVB-T coder
- ATSC/8VSB coder
- ISDB-T coder
- DVB-C coder
- J.83-B coder
- DVB-S/-DSNG coder
- ◆ I/Q output/input

Transmission simulation

- Fading simulator (6 or 12 paths)
- Noise generator
- BER measurement

Broadband FM options

- Broadband FM modulator
- FM sound subcarrier with internal audio generators
- ADR sound subcarrier with internal MUSICAM generators

Basic features

- Frequency range 0.3 MHz to 3.3 GHz
- ◆ Large level range −99.9 dBm to +13 dBm
- Simple, user-friendly hardkey and softkey control
- Large display with all important parameters in headline
- Status menu for supplementary information
- User-definable transmitter tables
- Storage of instrument settings internally and on memory card
- Online help
- ◆ IEC625/IEEE488 bus, RS-232-C interface
- Modular design
- Software update via RS-232-C interface (or memory card)

General

The TV Test Transmitter R&S®SFQ is a complete solution for testing digital TV links and receivers. The open-end software and modular hardware make the R&S®SFQ future-proof. The standards for DVB-T, DVB-S/DVB-DSNG, DVB-C, J.83-B, ATSC/8VSB and ISDB-T are fully complied with. Owing to its adaptability to future system changes, the R&S®SFQ is a useful and rewarding investment for your launch onto the digital TV market.

Moreover, the R&S®SFQ also processes analog frequency-modulated satellite signals in line with PAL, SECAM, NTSC standards. The sound signals are transmitted using analog FM and digital ADR sound subcarriers.

The test signals produced are of high precision and comply with the standards, but they can also be varied and provided with predefined errors to determine the performance of your products at their limits. The reproducible simulation of real transmission conditions by means of the noise generator and the fading simulator enables the specification of modules under test.

Applications

Because of its high signal quality and versatile parameters variations, the R&S®SFQ is ideal as a source for digital terrestrial signals (DVB-T, ATSC and ISDB-T), for testing satellite (DVB-S/-DSNG and FM) and digital cable links (DVB-C, J.83-B), as a standard-signal generator in development, as a reference in quality monitoring, EMC labs, inspection and test centers and for use in production. The output frequency range allows the R&S®SFQ to be used as a back-channel generator and covers future extensions of the satellite IF range.

Operational parameters (e.g. roll-off, puncturing rate or QAM mode) can easily be varied. For laboratory applications, values outside those defined in the standard can be selected. For special measurements, e.g. DVB-T, it is possible to switch off modulation, individual carriers or groups of carriers. Sweep can be performed over the complete RF range.

A shift function for frequency, level and C/N makes it possible to determine the functional limits of the DUT, compensate for external matching pads, adjust two units to give exactly the same output signal, etc. The advantage is that the output signal can be changed as required while the standard/nominal value continues to be displayed on the R&S®SFO.

The analog R&S®SFQ supplies frequency-modulated satellite signals conforming to standards. Various TV standards can be selected and up to six sound subcarriers (FM and ADR) can be integrated. In addition, external sound subcarriers can be applied. Operational parameters are in line with standards; parameters such as amplitude, frequency and deviation are variable. Signals such as noise or energy dispersal can be added. It is thus possible to test satellite links and receivers with the aid of standard signals and to check the response to nonstandard signals.

DVB: coding and mapping for antenna, satellite and cable

The I/Q coders of the TV Test Transmitter R&S®SFQ encode the applied transport stream for terrestrial transmission via antenna or for satellite or cable transmission in line with standards and condition it so that I and Q (inphase and quadrature) signals are obtained. The R&S®SFQ accepts MPEG transport streams with a packet length of 188 or 204 bytes. The input interfaces are synchronous parallel (TS parallel, SPI) and asynchronous serial (ASI). The input data rate and the symbol rate for DVB-C, DVB-S and DVB-DSNG modulation are selectable. With DVB-T modulation, the channel bandwidths of 6 MHz. 7 MHz and 8 MHz can be selected: their default settings can be varied.

Instead of the external transport data stream (DATA) being used, an internal data source can generate null transport stream packets (NULL TS PACKET, as defined in the DVB Measurement Guidelines), or an unpacketed random sequence (PRBS). The PRBS sequence is also available in packeted form in the null transport stream packets (NULL PRBS PACKET). The R&S®SFQ warns the user if

the input signal fails, the set data rate does not match the incoming one or the USEFUL DATA RATE is too high.

The input data stream is linked to a random sequence, ensuring that the signal energy is evenly distributed (energy dispersal). Energy dispersal can be switched off. The same applies to SYNC BYTE inversion.

Following energy dispersal, a Reed-Solomon coder (204,188) is provided as an outer encoder for forward error correction (FEC). 16 parity bytes are added to the unchanged 188 data bytes of each transport stream packet. These 16 parity bytes form the redundancy that allows eight errored bytes of a frame to be corrected by the receiver. A convolutional interleaver distributes the data so that consecutive bits are separated. Burst errors occurring on the transmission path are split up by the de-interleaver into single errors that can be corrected by the Reed-Solomon decoder. The interleaver, too, can be disabled.

Up to and including the convolutional interleaver, coding is identical for antenna (COFDM), satellite (QPSK, 8PSK, 16QAM) and cable (QAM) transmission. No further

FEC coding is provided for cable transmissions, as in this case interference due to noise, nonlinearities and interruptions is less likely than on satellite links or with antenna transmissions. With cable transmissions, mapping into the I and Q paths is performed next.

For terrestrial transmissions via antenna and for satellite transmissions, additional inner FEC coding is performed after the convolutional interleaver. The procedure, which is known as convolutional encoding, doubles the data rate. Puncturing is carried out next, i.e. certain bits are left out in the transmission according to a defined algorithm, so that the data rate is reduced again.

With DVB-S satellite transmissions, mapping into the I and Q paths is performed at this point. Instead of the convolutional encoder (DVB-S), a pragmatic trellis coding type is used for DVB-DSNG satellite transmission.

For terrestrial transmissions, the signal is made to pass through further FEC stages because of the inherently unfavorable propagation conditions: an inner bit

interleaver (at the antenna end) and a symbol interleaver. Next, mapping is performed according to the selected QPSK, 16QAM or 64QAM constellation. After insertion of the pilot and TPS (transmission parameter signalling) carriers in the frame adapter, conversion of the frequency domain to the time domain is effected by an inverse fast Fourier transform, to a 1705 (2K) or 6817 (8K) carrier depending on the selected mode. As a last step, the quard interval is inserted.

Prior to modulation, the spectrum has to be limited by filtering. The roll-off factor (root cosine) can be varied in for DVB-S, DVB-DSNG and DVB-C.

ATSC/8VSB: coding and mapping for antenna

The I/Q coder for 8VSB of the TV Test Transmitter R&S®SFQ encodes the applied transport stream for terrestrial transmission via antenna in line with standards and processes it so that I and Q (inphase and quadrature) signals are obtained.

With 8VSB, the R&S®SFQ accepts MPEG transport streams with a packet length of 188 bytes. The input interfaces are synchronous parallel (TS parallel, SPI), asynchronous serial (ASI) and serial (SMPTE310M).

When using the TS parallel input, an input data rate of 19.3926 Mbit/s ±10% can be attained. Use of the optional input interface yields a USEFUL DATA RATE in a wide range of up to 19.3926 Mbit/s.

The R&S®SFQ warns the user if the input signal fails or if the USEFUL DATA RATE is too high. Instead of the external transport stream (DATA) being applied, an internal data source can generate null transport stream packets (NULL TS PACKET, NULL PRBS PACKET). A SYNC PRBS is implemented for bit error evaluation in receivers. An unpacketed random sequence may also be selected. With 8VSB the PRBS sequence can be selected before (PRBS) BEFORE TRELLIS) or after the trellis coder (PRBS AFTER TRELLIS). The PRBS sequence is also available in packeted form in the null transport stream packets (NULL PRBS PACKET).

Generation of the standard frame is followed by a randomizer which ensures that energy is evenly distributed in the channel (energy dispersal). The randomizer can be disabled. Following energy dispersal, a Reed-Solomon coder (208, 188) is provided for forward error correction (FEC). 20 parity bytes are added to the unchanged 188 data bytes. Up to ten errors per segment can thus be corrected. A convolutional interleaver changes the position of the individual bytes so that consecutive bytes are separated. Burst errors occurring on the transmission path are split up by the receiver into individual errors that can be corrected by the Reed-Solomon decoder. The interleaver can be disabled. A trellis coder follows for further FEC. The segment sync and the field sync pulses are inserted after the interleaver or trellis coder. The mapper assigns the relevant amplitude steps to the symbols. The pilot used by the receiver for synchronization is also added in the mapper. The pilot amplitude can be modified and switched off. Prior to modulation, the spectrum must be limited by appropriate filtering. The roll-off is permanently set to 0.115 (root cosine).

Status menu

ISDB-T: coding and mapping for antenna

The ISDB-T (terrestrial integrated services digital broadcasting) coder of the R&S®SFQ encodes an MPEG-2 data stream in line with standards for transmission in the RF channel. The transport stream first passes through the outer coder where each transport stream packet undergoes Reed-Solomon encoding. The receiver is thus able to correct up to eight errored bytes in one transport stream packet.

The error-protected data stream then passes through a splitter which divides the transport stream packets between as many as all three hierarchical layers. The subsequent energy dispersal module adds a pseudo random binary sequence (PRBS) to the data stream to ensure a sufficient number of binary changes.

Depending on the two transmission parameters "modulation" and "code rate", a varying delay of the data stream in the three paths is obtained through bytewise interleaving in the transmitter and de-interleaving in the receiver. Delay adjustment is performed in the coder to minimize the technical effort at the receiver end. In this module, the three data streams are delayed so that subsequent delay differences can be compensated for beforehand.

Bytewise interleaving separates initially adjacent bytes and thus makes the signal resistant to burst errors.

The convolutional coder with integrated puncturer adds further redundancy to the data stream to permit error correction in the receiver (Viterbi decoder). The code rate can be selected according to the

required transmission characteristics of the system.

Modulation comes next. It includes bitwise interleaving with delay adjustment and mapping to the modulation constellation diagram. Possible ISDB-T constellations are DQPSK, QPSK, 16QAM and 64QAM. The constellation can be selected according to the required transmission characteristics of the system. Appropriate bitwise interleaving and delay adjustment are automatically selected.

The hierarchical data stream is then synthesized. For this purpose, the complex mapped data from each of the three paths is added to form a serial data stream.

Synthesis is followed by symbol-bysymbol time interleaving which is performed by an intra-segment time interleaver

8 VSB

Status menus

whose depth can be selected specifically for each layer. Delay adjustment is also assigned to the time interleaver in order to compensate for different delays in the paths.

Subsequent frequency interleaving scrambles the data in an OFDM symbol, i.e. in the frequency domain. First an inter-segment interleaver is applied between the OFDM segments that have the same modulation, followed by an intra-segment interleaver that rotates the data in a segment. Finally, the data passes through an intra-segment randomizer that shifts the data in a segment to quasi-random positions.

The next step is OFDM framing. Frames are formed from 204 OFDM symbols by adding pilot carriers. Depending on the mode and the selected modulation, pilot carriers are inserted into the data stream at different positions. Moreover, TMCC (transmission and multiplexing configuration control) carriers and AC (auxiliary channel) carriers are added.

The data generated in this way undergoes inverse fast Fourier transform (IFFT) to transfer it from the frequency domain

to the time domain as is usual with OFDM modulation. The length of IFFT depends on the selected ISDB-T mode and can be 2K, 4K or 8K.

IFFT is followed by the insertion of the guard interval. This guard interval extends the OFDM symbols by a specific factor (1/4, 1/8, 1/16 or 1/32). This measure has a positive effect on the receiving characteristics in the case of multipath propagation and mobile reception.

ITU T J.83-B: coding and mapping for cable

The symbol rate of the coder and consequently the bandwidth of the output signal can be varied over a wide range of $\pm 10\%$ of the standard symbol rate.

Larger variations of the symbol rate can be made in the TS parallel mode, where the symbol rate of the coder immediately follows the coder input data rate. However, conformance with specifications cannot be warranted outside the range $\pm 10\%$.

The data signal applied to the R&S®SFO can be replaced with an internal test sequence (NULL TS PACKETS, NULL PRBS PACKETS, SYNC PRBS), which is helpful for BER measurements.

Coding: The coder expects an MPEG-coded input data stream packetized to standard with a packet length of 188 bytes. The data is divided into packets by means of a sync byte (47 hex) in the transport stream, the sync byte also being used for receiver synchronization.

In the J.83-B cable transmission system, additional error control is introduced at the transport stream level by means of a sliding checksum, calculated for the transport stream packets, and substituted for the sync byte. This check sum byte allows the receiver to synchronize to the packets and to check for errored packets.

The J.83-B FEC layer, which is next, accepts and transports data without any restrictions imposed by the protocol, i.e. checksum generation and FEC coding are completely independent processes.

FEC in the J.83-B system is implemented in the four following stages to ensure reliable data transmission via cable:

- Reed-Solomon coding (128, 122) for outer error correction, allowing up to three symbols in a Reed-Solomon block to be corrected
- A convolutional interleaver distributing consecutive symbols uniformly across the data stream, thus protecting the signal from burst-type impairments
- A randomizer to give a uniform power density in the channel
- Trellis coding for inner error correction, involving convolutional coding of data and adding defined redundant information to the symbols, thus enabling the receiver to detect and correct any sporadic impairments on the transmission path by means of soft-decision methods

The randomizer, interleaver and Reed-Solomon coder can be switched off, which is very useful when receivers are being developed.

All interleaver modes defined in J.83-B are implemented (level 1 and level 2), allowing the system to adapt easily to different transmission conditions.

FEC frame: With 64QAM, a frame sync trailer is inserted after 60 Reed-Solomon packets (with 256QAM after 88 Reed-Solomon packets), thus forming an FEC frame. The frame sync trailer is a sync word that carries information about the current interleaver configuration. The trailer is inserted immediately ahead of trellis coding and used by the receiver for FEC synchronization and interleaver mode evaluation.

The trellis coder for 64QAM performs differential coding of the input data as well as 4/5 punctured convolutional coding. The overall code rate is 14/15, i.e. the trellis coder generates 15 output bits from 14 input bits. The output word length of the trellis coder is 6 bits, corresponding to the modulation level of 6 for 64QAM. The output signal of the trellis coder is applied to the mapper, which converts the symbols formed by the trellis coder into constellation points. The trailer is also coded by the trellis coder like normal FEC data and, because of its length, occupies all the bit positions in a trellis group.

The differential/convolutional encoder in the trellis block for 256QAM is identical to the 64QAM trellis coder but has an overall code rate of 19/20. In contrast to 64QAM, the trailer is inserted only at the differentially coded bit positions of a trellis group and transmitted in five sync trellis groups because of its length. The output word length is 8 bits, corresponding to 256 constellation points.

After the mapper and prior to modulation, the output spectrum is band-limited by a √cos roll-off filter to match the 6 MHz channel spacing. Roll-off is 0.18 with 640AM and 0.12 with 2560AM in line with the standard

Input interface

The optional input interface adds two further inputs to the base units TS PARALLEL input in LVDS (low voltage differential signalling) format: SPI (synchronous parallel interface) and ASI (asynchronous serial interface). An SMPTE310M input is moreover available in the case of ATSC/8VSB and J.83-B.

SPI and ASI inputs allow setting of the symbol rate independently of the input data rate, so that the input data rate is independent of the symbol rate or channel bandwidth. To this effect, all null packets are removed. The data rate required for a given symbol rate or bandwidth is obtained by stuffing, i.e. by inserting new null packets. The PCR (program clock reference) values are adapted. A built-in synthesizer ensures an accurate data clock at all inputs. For synchronization to a receiver, an external clock can be applied to ASI and SPI instead of the internal clock.

Fading simulation

For receiver testing, it is necessary to simulate all real-life transmission conditions as completely as possible and in a reproducible way. The R&S®SFQ caters for this necessity by offering a fading simulator in addition to the noise generator. The fading simulator is indispensable for the simulation of terrestrial – and in particular mobile - receive conditions, but can also be used for QAM and QPSK (max. 14 MHz RF bandwidth), for example to simulate reflection. For fading simulation, a signal is passed through 6 or 12 parallel paths which are combined again ahead of the modulator. Each active simulation path shapes the signal independently of the other paths and without any synchronization between the paths.

For each path, loss and delay can be set individually and a profile selected. Various profiles are available. The constant phase profile allows extremely short delays to be simulated.

Typical operating menu

Setup menu for fading: regular TU50 (i.e. typical urban, 50 km/h, 6 paths)

The pure Doppler profile is suitable for the simulation of mobile reception. Mobile reception means that the receiver is moving or the signal is reflected by a moving object. The assumed speed of movement can be varied over a wide range. Moreover, the direction of movement can be defined with reference to the transmitter site. Special profiles have been developed for the reproducible simulation of complex scenarios. The profiles are based on the WSSUS (wide sense stationary uncorrelated scattering) model and are recommended by the relevant DVB and DAB bodies (MOTIVATE, COST 207, EUREKA 147). Rayleigh fading, for example, simulates a radio field with many strongly scattered partial waves uniformly distributed and arriving at the mobile receiver from all directions. Rice fading simulates the same situation as Rayleigh fading, but with a variable, discrete component received via a direct path. Lognormal fading simulates slow variation of the receive amplitude; together with Rayleigh fading, Suzuki fading is obtained.

To configure a complete channel simulation model, a large number of parameters has to be set for each of the 6 or 12 paths: on/off, profile, loss, delay, speed/Doppler frequency, direction, discrete component, local constant for lognormal. To provide for comparable, reproducible measurements, international bodies recommend the use of defined channel models, for example typical urban, rural area, hilly terrain, difficult RA250 (difficult rural area, 250 km/h). The fading simulator offers the recommended as well as frequently used channel models as predefined setups for convenient testing. All parameters can be modified to match the requirements of a given task.

Following the fading simulator, all paths are combined for modulation. Simulation may cause a considerable change of RF power. Depending on the settings of the FADING POWER parameter (MULTIPATH or MAIN), the R&S®SFQ displays the total power of all paths involved or the power of the main path. The C/N ratio is set according to the two power models.

With different phases in the individual paths, RF power may be reduced through cancellation and, more frequently, increased through addition of the paths. Therefore, with the fading simulator switched on, the maximum RF level is reduced to avoid overloading.

DVB-T spectrum with constant phase (phase 0 degree, delay 0 µs/0.45 µs, 2 paths) and regular TU50 fading (typical urban, 50 km/h, 6 paths)

Noise generator

The noise generator produces broadband white noise with a Gaussian distribution. The power density of the noise signal can be set indirectly as C/N (carrier-to-noise) ratio.

This is extremely convenient for the user as the C/N ratio can be entered in dB immediately after selection of the demodulator receive bandwidth. The receive bandwidth is set to match the symbol rate but can be modified. The R&S®SFQ can thus simulate different types of interference as they really occur along the satellite, cable or antenna transmission path to the receiver. The C/N ratio is set according to the two fading power models (FADING POWER). Featur-

DVB-C spectrum without and with noise (24 dB C/N), associated I/Q constellations

Circuit diagram with two R&S®SFQs and R&S®SFQ-Z5 cable set for generating diversity signals

- RF frequency above 10 MHz doubled
- Same fading profile, but uncorrelated
- Uncorrelated noise generators for every receive path
- Cascadable for several diversity signals

Impulsive noise

Together with the Noise Generator R&S®SFQ-B5 (from model 04), the option Impulsive Noise R&S®SFQ-B27 is also available for the TV Test Transmitter R&S®SFQ. It enables users not only to set an accurate C/N ratio that can be calibrated but also to superimpose impulsive noise.

Diversity simulation

For testing diversity receivers, each antenna of the receiver requires a separate RF signal. The RF signals must carry the same MPEG signal and be coupled to each other via the reference frequency. The interference simulation (noise, fading) produced by the individual transmitters must not be intercorrelated; this can be realized only by providing one R&S®SFQ per antenna. Only one MPEG-2 transport stream is used; the RF is coupled to the reference frequency (see block diagram opposite). To enable cascading, which is required for this application, the noise generator incorporates a splitter which can be activated by means of the accessory Cable Set R&S®SFQ-Z5.

BER measurement

The internal BER measurement facility permits the BER of receivers to be measured without external equipment being required. The demodulated data streams are fed back to the R&S®SFQ.

A selection can be made between the serial inputs DATA, CLOCK (BNC connectors, TTL level, 75 Ω) and the parallel input for MPEG signals (sub-D, LVDS level). The BER measurement is independent in its function from other settings in the R&S®SFQ and can be used with all digital modulation modes. The current BER is permanently displayed for this purpose.

A PRBS of 2²³-1 or 2¹⁵-1 to ITU-T Rec. 0.151 can be selected and evaluated. It ensures receiver synchronization and allows measurements over a very wide BER range.

A serial BER measurement can be performed after the demapper, for instance. For parallel measurements on MPEG-2 transmission systems, the R&S®SFQ is set to NULL PRBS PACKET. The BER measurement can thus be carried out before the Reed-Solomon decoder, for instance. The BER of set-top boxes can be determined with the aid of an adapter board for the Common Interface R&S®SFQ-Z17.

The BER measurement facility is located on the INPUT INTERFACE (model >.02) or on the DVB-T coder module, which means that the R&S*SFQ must be equipped with at least one of these modules.

I/Q modulation

In the I/Q modulator, the orthogonal I and Q components of the RF signal are controlled in amplitude and phase by the analog I and Q signals from the coder. The two RF components are added to give an output signal that can be amplitude- and phase-modulated as required. Assignment of I and Q components can be interchanged in the R&S®SFQ so that an inverted RF signal is obtained. High demands are placed on the I/Q modulator particularly with a view to high-order quadrature amplitude modulation. The internal calibration of the R&S®SFQ ensures that I and Q paths have identical gain, the phase is exactly 90° and carrier suppression at least 50 dB. Nonideal behaviour of an I/O modulator can be simulated by detuning amplitude, phase and carrier leakage in the R&S®SFQ. As a result, bit errors are produced that allow quality assessment of receivers and demodulators.

Data input for MPEG-2 data stream			
TS PARALLEL input	synchronous parallel (without stuffing), LVDS		
Characteristics	meet EN 50 083-9		
Input impedance	100 Ω		
Input level (V _{pp})	100 mV to 2 V		
Connector	25-contact female, shielded		
Symbol rate (DVB-C, DVB-S)			
Accuracy			
with external MPEG signal	synchronized to external MPEG signal		
without external MPEG signal	see optional input interface (R&S®SFQ-B6)		
ASI (asynchronous serial input,			
with stuffing)	see optional input interface		
SPI (synchronous parallel input,			
with stuffing)	see optional input interface		
SMPTE (synchronous input)	see optional serial input interface		

¹⁾ Valid for a warm-up period of 1 hour, recalibration for an operating time of 4 hours and temperature variations less than 5 degrees.

DVB/8VSB/ISDB-T/J.83-B

Input Interface	option R&S®SFQ-B6
SPI input	synchronous parallel (with stuffing), LVDS
Characteristics	meet EN50083-9
Input impedance	100 Ω
Input level (V _{PP})	100 mV to 2 V
Connector	25-contact female, shielded
ASI input	asynchronous serial, with stuffing
Characteristics	meet EN50083-9
Input impedance	75 Ω
Input level (V _{PP})	200 mV to 880 mV
Connector	BNC female
Input signal	270 Mbit
Stuffing bytes	single-byte and block mode
Input SMPTE 310	synchronous serial (only in conjunction
	with ATSC/8VSB coder)
Characteristics	meet SMPTE310M
Input impedance	75 Ω
Input voltage (V _{PP})	400 mV to 880 mV
Connector	BNC female
Data rate	19.392658 Mbit/s
Symbol rate (SPI, ASI)	selectable by inserting null PRBS
	packets (stuffing)
Inaccuracy of internal data clock	<±1·10 ⁻⁵
External clock	switchable between bit and byte clock
Signal, level	ΠL
Input impedance	high-impedance
Connector	BNC female
Internal transport stream	null transport stream packets with
	PRBS as payload (PRBS:
	2 ²³ -1/2 ¹⁵ -1 to ITU-T Rec. 0.151)

DVB-T Coder	option R&S®SFQ-B10	VSB level	8VSB
Characteristics	meet EN300744	Pilot	1.25, can be switched off
Input	TS PARALLEL; with R&S®SFQ-B6: ASI, SPI	Range	0 to 5 in steps of 0.125
Mode	MDFO	Pulse filtering (root cosine)	0.115 roll-off
DATA	MPEG input signal synchronized to input data rate	Special functions	randomizer, interleaver; can be switched off
NULL TS PACKET	null transport stream packets as de- fined by Measurement Guidelines for DVB Systems	Error simulation	selectable: carrier leakage, I/Q imbalance, I/Q phase error
NULL PRBS PACKET	null transport stream packets with PRBS	ISDB-T Coder	option R&S®SFQ-B26
	(PRBS: 2 ²³ -1/2 ¹⁵ -1 to ITU-T Rec. 0.151)	Characteristics	meet ARIB STD-B31, V1.0
PRBS before convolutional encoder PRBS after convolutional encoder	2 ²³ –1/2 ¹⁵ –1 to ITU-T Rec. 0.151 2 ²³ –1/2 ¹⁵ –1 to ITU-T Rec. 0.151	Inputs	TS PARALLEL + AUX and SPI with R&S®SFQ-B6: ASI

DVB-S/-DSNG Coder	ontion R&S®SFO-B23 (-B24)
Error simulation	selectable: carrier suppression, I/Q imbalance, I/Q phase error
Special functions	switchable: randomizer, Reed-Solomon coder
Data interleaver	level 1 and level 2; can be switched off
Pulse filtering (root cosine)	0.18 (64QAM), 0.12 (256QAM) roll-off
Bandwidth	6 MHz
Range	±10%
Symbol rate	5.0569 Msps for 64QAM, 5.360 Msps for 256QAM

Special functions	coder
Error simulation	selectable: carrier suppression, I/Q imbalance, I/Q phase error
DVB-S/-DSNG Coder	option R&S®SFQ-B23 (-B24)
Not in conjunction with option R&S®SF	Q-B6 model .02, R&S®SFQ-B6 model .03
recommended	
Characteristics	meet EN 300 421/EN 301 210
Type of modulation	QPSK, 8PSK, 16QAM
Code rate	QPSK: 1/2, 2/3, 3/4, 5/6, 7/8
	QPSK: ¹ / ₂ , ² / ₃ , ³ / ₄ , ⁵ / ₆ , ⁷ / ₈ 8PSK: ² / ₃ , ⁵ / ₆ , ⁸ / ₉ 16QAM: ³ / ₄ , ⁷ / ₈
	160AM: ³ / ₄ , ⁷ / ₈
Symbol rates	0.1 Msps to 80 Msps (selectable)
Pulse filtering	root cosine roll-off,
	alpha=0.35
	variable roll-off (0.25 to 0.45)
Energy dispersal	can be switched off
Reed-Solomon coder (204,188, $t=8$)	can be switched off
Convolutional interleaver	can be switched off
Convolutional encoder	can be switched off
Mode	
DATA	MPEG-2 input signal (without input sig-
	nal automatic switchover to PRBS with
	TS PARALLEL, stuffing with ASI, SPI)
NULL TS PACKET	null packets (PID = 1FFF, payload = 0)
NULL PRBS PACKET	null packets (PID = 1FFF, payload =
	PRBS, 2 ¹⁵ -1/2 ²³ -1 to ITU-T Rec. 0.151)
PRBS before convolutional encoder	2 ¹⁵ -1/2 ²³ -1 to ITU-T Rec. 0.151

I/Q Output/Input	option R&S®SFQ-B14
Output	
Output impedance	50 Ω
Output voltage	depending on selected modulation
Connector	BNC female
Input	
Input impedance	50 Ω
VSWR (DC to 30 MHz)	<1.4
Input voltage for full-scale level	$(I^2 + Q^2)^{1/2} = 0.5 \text{ V} (1 \text{ V EMF}, 50 \Omega)$
Connector	BNC female

Transmission simulation

Fading Simulator	option R&S®SFQ-B11
Model .02	paths 1 to 6 (R&S®SFQ delivered before 1999: see R&S®SFQ-B18)
Model .04	paths 7 to 12 (only in conjunction with R&S®SFQ-B11, model .02)
Reduced maximum RF output level	-5.5 dBm for DVB-T (single-path fading without loss)
RF output power	MULTIPATH: the RF level displayed is the sum of the power levels in the indi- vidual paths MAIN: the RF level displayed is the power of the main path
C/N ratio	maintained if fading parameters are changed; MULTIPATH: C=total power of all paths MAIN: C=power of main path
RF bandwidth (-3 dB)	>14 MHz
Frequency response up to 5 MHz offset from carrier frequency	<0.6 dB, typ. <0.3 dB
Carrier leakage	typ. 42 dBc
Number of paths with R&S®SFQ-B11 Model .02	6
Model .02 plus model .04	12

Path loss	
Range	0 dB to 50 dB
Resolution	0.1 dB
Inaccuracy (from 0 dB to 20 dB)	<0.3 dB
Path delay	
Range	0 μs to 1600 μs
Resolution	50 ns
Inaccuracy	<5 ns
Constant phase	
Range	0° to +359.9°
Resolution	0.1°
Pure Doppler	
Frequency range	0.1 Hz to 1600 Hz
Speed range	$v_{min} = (0.03 \cdot 10^9 \text{ m/s}^2)/f_{RF}$ $v_{max} = (479 \cdot 10^9 \text{ m/s}^2)/f_{RF}$
for f _{RE} =1 GHz	$v_{min} = 0.1 \text{ km/h}, v_{max} = 1724 \text{ km/h}$
Resolution	0.1 km/h, m/s, mph
Inaccuracy	<0.13%
Rayleigh fading	
Pseudo noise interval	>372 h
Deviation from theoretical CPDF ¹) at	
$P_{avg} = 0 dB$	
From -20 dB to +10 dB	<1 dB, typ. <0.3 dB
From -30 dB to -20 dB	<2 dB, typ. <0.3 dB
Rice fading	. 11
Power ratio ²)	
Range	-30 dB to +30 dB
Resolution	0.1 dB
Frequency ratio	
Range	-1 to +1
Resolution	0.05
Lognormal fading, Suzuki fading	
Standard deviation	
Range	0 dB to 12 dB
Resolution	1 dB
Local constant	I_{min} : up to 200 m $(I_{min} = (12 \cdot 10^9 \text{ m/s}^2)/f_{RF})$
Fading profile	selectable from a list of predefined pro- files; each profile can be modified as re- quired
Reference on frequency change	speed or Doppler frequency can be selected

Noise Generator	option R&S®SFQ-B5
Not in conjunction with R&S®SFQ-B2	(is already included)
Bandwidth	
Receiver bandwidth	0.1 MHz to 80 MHz (selectable)
Actual noise bandwidth	10 MHz/60 MHz
C/N setting	
Variation range	50 dB
Minimum selectable C/N	depending on bandwidth and modulation (see diagram)
Resolution	0.1 dB
C/N error	
Absolute error	<0.3 dB (after calibration), typ. <0.2 dB
RF frequency range	
With noise bandwidth ≤10 MHz	≥15 MHz
With noise bandwidth >10 MHz	≥60 MHz

Minimum selectable C/N ratio of Noise Generator R&S®SFQ-B5

Impulsive Noise	option R&S®SFQ-B27
Option R&S®SFQ-B27 only together wi	th option R&S®SFQ-B5 (from model 04)
Pulse input	BNC, 75 Ω, TTL
Pulse	
Width	min. 200 ns
Frequency	≤2.5 MHz
Low Level	C/N standard
High Level	switchover to IMPULSIVE C/N value
Difference, IMPULSIVE C/N relative to	
C/N	in 1 dB steps
Variation range	corresponds to C/N range of the option R&S®SFO-B5

BER Measurement	option R&S®SFQ-B17
Only in conjunction with option R&S®S	SFQ-B10 or option R&S®SFQ-B6 model .03
Characteristics	integrated BER measurement for all dig
	ital modulation modes (DVB-C, DVB-S,
	DVB-T, 8VSB, J.83-B, ISDB-T)
Input data rate	max. 60 Mbit/s (serial input)
PRBS	2 ²³ –1/2 ¹⁵ –1 to ITU-T Rec. 0.151
Input	
Serial	BER DATA, BER CLOCK, BER ENABLE
Input impedance	75 Ω
Input level	TTL
Connector	BNC female
Clock, data	normal, inverted
Enable	always, active high, active low
BER mode	22 15
PRBS	2 ²³ –1/2 ¹⁵ –1 to ITU-T Rec. 0.151
Parallel	TS PARALLEL AUX
Characteristics	meet EN50083-9
Input impedance	100 Ω
Input level	100 mV to 2 V, LVDS
Connector	25-contact female, shielded
BER mode	023 4 /015 4 . ITH T.D. 0 454
PRBS, PRBS INVERTED	2 ²³ –1/2 ¹⁵ –1 to ITU-T Rec. 0.151
NULL PRBS PACKET	evaluation of standard transport stream;
	total payload corresponding to PRBS (e.g.
	NULL PRBS PACKET of R&S®SFQ)
PID FILTER FOR PRBS PACKET	evaluation of null packets (PID=1FFF) of
	standard TS with payload correspond-
	ing to PRBS (e.g. stuffing with
	R&S®SFQ in ASI/SPI mode)

CPDF = cumulative probability distribution function, level values referred to average output level value.
 Ratio of discrete component to distributed component.

BB-FM

Broadband FM Modulator	option R&S®SFQ-B2
Analog modulation	broadband FM for video and FM/ADR sound subcarrier
Video transmission characteristics	
Type of modulation	frequency modulation (F3)
Standard	PAL, SECAM, NTSC; selectable
Nominal input level (V _{pp})	1 V (75 Ω)
Video frequency deviation	
Setting range	10 MHz to 40 MHz
Resolution	0.1 MHz
Hum suppression with level	
clamping on	>40 dB
Linear distortion	
Frequency response, 0 MHz to 5 MH.	Z
(ref. to 1.5 MHz and 25 MHz (pp)	
deviation, with preemphasis and	
lowpass filter)	<±0.5 dB
Group delay, 0 MHz to 4.8 MHz	<±20 ns with lowpass filter
Transients (streaking) with 200 ns	
rise and fall time	<±2%
Energy dispersal signal	
Signal type	25 Hz or 30 Hz triangular signal, coupled
	to frame frequency (625/525 lines)
Deviation, selectable	0 MHz to 4 MHz, automatically doubled
	when the video or baseband signal is
D 1.0	switched off
Resolution	100 kHz

Nonlinear distortion	
Measurements	with standard video signal and preemphasis and deemphasis switched on
Differential gain at 25 MHz deviation	<1.5%
Differential phase at 25 MHz	
deviation	<1.5°
Video-frequency S/N ratio, ref. to	
22.5 MHz deviation, with preemphasis	
and deemphasis 100 kHz to 5 MHz	>70 dB rms, weighted to ITU-R

Internal noise generator	
Bandwidth	
Receiver bandwidth	0.1 MHz to 80 MHz (selectable)
Actual noise bandwidth	10 MHz/60 MHz
C/N setting	
Variation range	50 dB
Minimum selectable C/N	depending on bandwidth and modula-
	tion (see diagram for R&S®SFQ-B5, FM)
Resolution	0.1 dB
C/N error	<1 dB
RF frequency range	
With noise bandwidth ≤10 MHz	≥15 MHz
With noise bandwidth >10 MHz	≥60 MHz

2 FM Sound Subcarriers	option R&S®SFQ-B3
Only in conjunction with option R&S®	SFQ-B2 (included once in R&S®SFQ-B2)
Number of subcarriers per module	2
Frequency range	5 MHz to 9 MHz
Resolution	10 kHz
Frequency deviation of IF carrier	
caused by FM sound subcarriers	
Setting range (RF deviation)	1 MHz (pp) to 4 MHz (pp)
Resolution	10 kHz
Audio signal input	
Frequency range	30 Hz to 15 kHz
Bandwidth without lowpass filter	100 kHz
Nominal input level	$+9$ dBm (600 Ω)
Input impedance	$>$ 5 k Ω , balanced
Connector	Lemo Triax
Internal modulation generator (DSP)	
Frequency range	30 Hz to 15 kHz
Resolution	100 Hz
Modulation distortion	<0.5%
Audio S/N ratio (ref. to 50 kHz de	-
viation, AC-coupled)	>65 dB, weighted to CCIR
Preemphasis	50 μs, 75 μs, J.17, OFF; selectable

2 ADR Sound Subcarriers	option R&S®SFQ-B4
Only in conjunction with option R&S®	SFQ-B2 (to ADR specifications)
Number of subcarriers	2
Frequency range	0.1 MHz to 9 MHz
Resolution	10 kHz
Frequency deviation of IF carrier	
caused by ADR sound subcarriers	
Setting range (RF deviation)	1 MHz (pp) to 4 MHz (pp)
Resolution	10 kHz
Type of modulation	QPSK
Source data	internal, external, PRBS
Source data rate	192 kbit/s
Transmission rate	256 kbit/s
QPSK test	4 selectable test patterns; I/Q reversal
Bit error generator (symbol errors)	10^{-2} to 10^{-6}
External data input	only for one of the two subcarriers
Туре	clock (invertible) and data
Level	RS-422
Data rate	192 kbit/s
Internal MUSICAM generator	two generators independent of each
	other (to ISO/IEC 11172-3 Layer II)
Mode	single, dual, stereo
Ancillary data (ANC)	1 of 4 internal data records can be se-
	lected, update from memory card
Audio generator	two for each MUSICAM channel
Frequency range	10 Hz to 20 kHz; 10 Hz steps
Amplitude range	100 dB; 0.1 dB steps
Preemphasis	50/15 μs, OFF

General data

Transmitter tables	5 with 100 entries each, editable or
	loadable by remote control
Storage of instrument settings	internally and on memory card
Interfaces	IEC 625/IEEE 488 bus, RS-232-C
Operating temperature range	+5°C to +45°C
Permissible temperature range	0°C to +50°C
Storage temperature range	−40°C to +70°C
Mechanical resistance	
Vibration, sinusoidal	5 Hz to 150 Hz, max. 2 g at 55 Hz, 55 Hz
	to 150 Hz, 0.5 g const., meets
	EN 60068-2-6, EN 61010-1,
	MIL-T-28800 D class 5
Vibration, random	10 Hz to 300 Hz, acceleration 1.2 g (rms)
Shock	40 g shock spectrum, meets
	MIL-STD-810 C and MIL-T-28800 D
	classes 3 and 5

Climatic resistance	95% rel. humidity, cyclic test at $+25$ °C/ $+40$ °C, meets EN 60068-2-30
Electromagnetic compatibility	meets EMC directive of EU (89/336/EEC) and German EMC legislation
Power supply	90 V to 132 V/180 V to 265 V (autoranging), 47 Hz to 440 Hz (170 VA)
Electrical safety	meets EN 61010-1
Dimensions (W \times H \times D)	435 mm × 192 mm × 460 mm
Weight	approx. 20 kg, depending on options fitted

Rear view of the R&S®SFQ
